Getting SML

- ▶ Head over to smlnj.org
 - ▶ Click on Downloads
- ▶ Or use your favorite package manager (Homebrew, yum, etc.)

Using SML Interactively

- ▶ `sml` at the command prompt

... we'll talk later about non-interactive usage.

Environment

Tuples and Lists

- ▶ **Integers:** 0, 22, 353,...
- ▶ **Reals:** 12.0, 3E-2, 3.14e12
- ▶ **Booleans:** true, false
- ▶ **Strings:** "KSU", "foo\n"
- ▶ **Characters:** #"x", #"A", #"\n"

Procter
from Amtoft
from Hatcliff
from Leavens

```
- 2;  
val it = 2 : int  
- it + 1;  
val it = 3 : int  
- it;  
val it = 3 : int  
- ~234 + 2;  
val it = ~232 : int  
- 12.0;  
val it = 12.0 : real  
- 12. + 3.1;  
stdIn:16.1 Error: syntax error found at DOT  
- "KSU";  
val it = "KSU" : string  
- "foo\n";  
val it = "foo\n" : string  
- #"x";  
val it = #"x" : char  
- #"gh";  
... Error: character constant not length 1
```

from Leavens

Precedence: lowest to highest

- ▶ +, -
- ▶ *, /, div, mod
- ▶ ~

Also:

- ▶ ML is case sensitive (cf. `mod`)
- ▶ associativity and precedence as in other languages
- ▶ operators associate to the left
- ▶ parentheses are
 - ▶ needed only to enforce evaluation order, as in $x * (y + z)$
 - ▶ but may be freely added to improve clarity, as in $x + (y * z)$

Diving into SML

Basics

Typing

Environment

Tuples and Lists

Procter
from Amtoft

Concatenation:

```
- "abra" ^ "cadabra";  
val it = "abracadabra" : string  
  
- "abra" ^ "" ^ "cadabra" ^ "";  
val it = "abracadabra" : string  
  
- "abra" ^ ("" ^ "cadabra") ^ "";  
val it = "abracadabra" : string
```

- ▶ "" (empty string) is identity element
- ▶ ^ is associative

Diving into SML

Basics

Typing

Environment

Tuples and Lists

Comparison Operators

=, <, >, <=, >=, <>

Note:

- ▶ cannot use = or <> on reals
 - ▶ to avoid problems with rounding
 - ▶ use e.g., <= and >= for =
- ▶ < means “lexicographically precedes” for characters and strings

```
- "a" < "b";  
val it = true : bool  
- "c" < "b";  
val it = false : bool  
- "abc" < "acb";  
val it = true : bool  
- "stuv" < "stu";  
val it = false : bool
```

“Problems with Rounding”

Example

- ▶ $1.1 + 2.2 = 3.3$ right?

Nope!

- ▶ $\frac{2476979795053773}{2251799813685248} + \frac{2476979795053773}{1125899906842624} \neq \frac{3715469692580659}{1125899906842624}$

not , andalso , orelse

- ▶ behave like C's !, &&, || — not like Pascal
- ▶ not commutative, as “short-circuit” operation

```
- (1 < 4) orelse ((5 div 0) < 2);  
val it = true : bool  
- ((5 div 0) < 2) orelse (1 < 4);  
** error **
```

Diving into SML

Tuples and Lists

If-then-else Expressions

Examples:

```
- if 4 < 3 then 'a' else 'bcd';  
val it = 'bcd' : string  
  
- val t = true;  
val t = true : bool  
- val f = false;  
val f = false : bool  
  
- if t = f then (5 div 0) else 6;  
val it = 6 : int  
  
- if t = true then 7 else 'foo';  
... Error: types of rules don't agree...  
  earlier rule(s): bool -> int  
  this rule: bool -> string  
  in rule:  
    false => 'foo'
```

[Environment](#)

[Tuples and Lists](#)

ML has strong typing:

(strong/weak = how much)

- ▶ each value has exactly one type
- ▶ for example, 12 is `int` but not `real`
- ▶ explicit coercions therefore necessary

ML has static typing:

(static/dynamic = when)

- ▶ type-checking occurs *before* programs are run
 - ▶ thus `if x = y then 7 else "foo"` is an error
 - ▶ but it wouldn't be in a dynamically typed language

These concepts are too often mixed up, even in the Ullman textbook (pages 3 and 143)

from Hatcliff
from Leavens

From integers to reals:

```
- real(11);  
val it = 11.0 : real  
- 5.0 + 11;  
... Error: operator and operand mismatch  
operator domain: real * real  
operand:         real * int  
in expression:  
    5.0 + 11  
- 5.0 + real(11);  
val it = 16.0 : real
```

From reals to integers:

```
- floor(5.4);  
val it = 5 : int  
- ceil(5.4);  
val it = 6 : int  
- round(5.5);  
val it = 6 : int  
- trunc(~5.4);  
val it = ~5 : int
```

Diving into SML

Basics

Tuples and Lists

Between characters and integers:

```
- ord("#0");  
val it = 48 : int  
  
- chr(48);  
val it = "#0" : char
```

Between strings and characters:

```
- str("#a");  
val it = "a" : string
```

What about from int to string?

What about from string to character?

Diving into SML

Basics

Typing

Environment

Tuples and Lists

Which of the following do you think are valid SML identifiers?:

- ▶ myVar (Yes)
- ▶ myVar_42 (Yes)
- ▶ myVar' (Yes)
- ▶ ++ (Yes)
- ▶ t@coc@t (No)
- ▶ %-/-< (Definitely)

Procter
from Amtoft
from Hatcliff
from Leavens

SML has two classes of identifiers:

- ▶ alphanumeric (e.g., `abc`, `abc'`, `A_1`)
- ▶ symbolic (e.g., `+`, `$$$`, `%-%`)

Alphanumeric Identifiers: strings formed by

- ▶ An upper or lower case letter or the character `'` (called apostrophe or “prime”), followed by
- ▶ Zero or more additional characters from the set given in (1) plus the digits and the character `_` (underscore).

Symbolic Identifiers: strings composed of

`+ - / * < > = ! @ # $ % ^ & ' ~ \ | ? :`

Diving into SML

Typing

Environment

Tuples and Lists

Consider from Pascal: $A := B + 2;$

- ▶ B is a *variable reference* (contrast with A)
- ▶ a memory location is associated with A
- ▶ a stored value (e.g., 5) is associated with B

Pascal, C, Java, Fortran, etc:

- ▶ variables bind to locations
- ▶ there is a level of indirection
- ▶ two mappings
 - ▶ environment: maps variables to locations
 - ▶ store: maps locations to values

Procter
from Amtoft
from Hatcliff
from Leavens

SML: variables bound to values

`<var> = <value>`

- ▶ variables bind directly to values
- ▶ there is no indirection
- ▶ a binding **cannot be modified**
- ▶ there is **no assignment**
- ▶ one mapping
 - ▶ environment: maps variables to values

```
- val a = 2;  
val a = 2 : int  
- val b = 3;  
val b = 3 : int  
- val c = a + b;  
val c = 5 : int  
- val a = c + 2;  
val a = 7 : int  
- val c = c + 2;  
val c = 7 : int
```

var	value
a	2
b	3
c	5
a	7
c	7

Procter
from Amtoft
from Hatcliff
from Leavens

Tuple: fixed-size ordered collection of two or more values.

```
- val t = (1, "a", true);  
val t = (1,"a",true) : int * string * bool  
- #3(t);  
val it = true : bool  
  - val s = (4, t);  
val s = (4,(1,"a",true)) :  
      int * (int * string * bool)  
- #2(#2(s));  
val it = "a" : string  
- (4);  
val it = 4 : int  
- ();  
val it = () : unit  
- #2 t;  
val it = "a" : string  
- #4(t);  
stdIn:16.1-16.6 Error: ...
```

Tuples and Lists

Procter
from Amtoft
from Hatcliff
from Leavens

ML lists are lists of values of the same type.

Example session:

```
- [1,2,3];  
val it = [1,2,3] : int list  
- [(1,2),(2,3),(3,4)];  
val it = [(1,2),(2,3),(3,4)] :  
      (int * int) list  
- ["a"];  
val it = ["a"] : string list  
- ["a",2];  
... Error: operator and operand don't agree...  
- [[1],[2],[3]];  
val it = [[1],[2],[3]] : int list list  
- [];  
val it = [] : 'a list
```

Diving into SML

Basics

Typing

Environment

Tuples and Lists

Tuples vs. Lists: What's the difference?

- ▶ Lists: (Always) **same** types
- ▶ Tuples: (Possibly) **different** types

But ok, can't tuples do it all then?

- ▶ Tuples (generally) are sequences of different kinds of stuff, and you deal with the tuple as a coherent unit.
 - ▶ A location type might be (latitude, longitude, altitude). We don't really ever do something to each element (like double it) because the tuple only makes sense as a whole unit.
- ▶ Lists (generally) are sequences of the same kind of stuff, and you deal with the items individually.
 - ▶ A shopping list might be like ["Funfetti Cake Mix", "Eggs", "Oil", "Funfetti frosting"]. When we shop, we want to iterate over the list, and do something with (ie, buy) each item.

Polymorphic List Operations

```
empty list  [] : 'a list
head        hd  : 'a list → 'a
tail        tl  : 'a list → 'a list
append      @   : 'a list * 'a list → 'a list
cons        ::  : 'a * 'a list → 'a list
```

Procter
from Amtoft
from Hatcliff
from Leavens

Diving into SML

Basics

Typing

Environment

Tuples and Lists

Example session:

```
- val ls = [1,2,3];
val ls = [1,2,3] : int list
- hd(ls);
val it = 1 : int
- hd(["a","b","c"]);
val it = "a" : string
- tl(tl(ls));
val it = [3] : int list
- tl(tl(ls)) @ ls;
val it = [3,1,2,3] : int list
- 3 @ ls;
... Error: operator and operand don't agree
- 3 :: ls;
val it = [3,1,2,3] : int list
```

Procter
from Amtoft
from Hatcliff
from Leavens

Example session:

```
- explode("abcd");  
val it = [#"a",#"b",#"c",#"d"] : char list  
- implode([#"f",#"o",#"o"]);  
val it = "foo" : string  
- implode(explode("abcd"));  
val it = "abcd" : string  
- explode(implode([#"f",#"o",#"o"]));  
val it = [#"f",#"o",#"o"] : char list
```

Strings \leftrightarrow List Coercion

Procter
from Amtoft
from Hatcliff
from Leavens

```
- "abc" ^ implode([#"f",#"o",#"o"]) ^ "bar";  
val it = "abcfoobar" : string  
- ([4,5],[2],[ord(#"c")]);  
val it = ([4,5],[2],[99]) :  
          int list * int list * int list  
- "abc" > "foo";  
val it = false : bool  
- 7 :: 5;  
stdIn:37.1-37.7 Error:  
  operator and operand don't agree [literal]  
- ["a","b",#"c","d"];  
stdIn:1.1-30.2 Error: operator and operand  
  don't agree [tycon mismatch]  
- 20 + (if #"c" < #"C" then 5 else 10);  
val it = 30 : int  
- ((()),(),[()],([]));  
... : unit * unit * unit list * 'a list
```
